Week 3 Rubric: How Your Worksheets Are Marked

Session 1: Crypto Market Structure and a Self-Custody Wallet Lab
Session 2: Designing a Custody Policy, and the Mining Energy and Environment Debate

IT8204 Blockchain and Cryptocurrency | Assessment 2 (A2), the weekly worksheets | Worth 2.50 percent of the course | Deadline for both worksheets: Friday 2 October 2026, 23:59

How your mark is worked out

- Your two Week 3 worksheets are marked together, on the eight criteria in this rubric.
- Each criterion gets a score from 0 to 5. Decimal scores are allowed, for example 3.5.
- Each criterion has a weight. The eight weights add up to 100.
- Your mark for one criterion is the score divided by 5, times the weight. For example, a score of 4 on a criterion weighted 13 gives 4 divided by 5, times 13 = 10.4 marks.
- Your Week 3 mark is the total of the eight, out of 100. It counts for 2.50 percent of the course, inside your A2 total. The course result is decided on your overall course mark.

What each score means

Score	Level	What it means
0	Missing	No evidence / not attempted.
1	Limited	Attempted but cannot give a basic explanation; mostly incorrect.
2	Basic	Below expectation; major gaps.
3	Reasonable	Meets the task; major enhancement still possible.
4	Very Good	Minor enhancement only; valid and well justified.
5	Excellent	Fully meets the task + critical insight / self-reflection.

A 4 sits between the 'Reasonable (3)' and 'Excellent (5)' descriptions below. A 0 means there is no evidence for that criterion.

The eight criteria

C1. Session 1, Task 2 - your individual build task (weight 13)

What is marked	Session 1 worksheet, Task 2: classify three wallet arrangements by operational risk. They are an overseas exchange account, MetaMask on a laptop, and a hardware wallet with 2-of-3 multi-signature.
Excellent (5)	All three arrangements get a risk class and the main failure each one exposes you to. Each answer says who holds the keys and why that creates the risk.
Reasonable (3)	All three are classified and the failures are mostly right. At least one reason is missing, or only repeats the risk label.
Limited or Basic (1-2)	One or more arrangements are missing. Or risks are named without saying who holds the keys or what could go wrong.

C2. Session 2, Task 2 - your individual build task (weight 13)

What is marked	Session 2 worksheet, Task 2: the Bahraini family office that holds Bitcoin in an omnibus account, where the overseas exchange pools all clients' assets in one wallet.
Excellent (5)	Names the specific custody risk that pooling creates and how it would hurt the family office. Gives ONE mitigation that directly reduces that risk, with a reason.
Reasonable (3)	Names a relevant custody risk and a mitigation, but the link between them is not explained, or the risk is described only in general terms.
Limited or Basic (1-2)	A general comment that crypto is risky, with no custody risk named. Or a mitigation that does not fit the pooled-account problem.

BAHRAIN POLYTECHNIC بوليتكنك البحرين

C3. Session 1, Task 3 - your own write-up of the group activity (weight 13)

What is marked	Session 1 worksheet, Task 3: the self-custody wallet lab on the Sepolia test network (practice network only, never real funds).
Excellent (5)	Every lab step is done and shown: wallet created, seed-phrase security described, test transaction sent and read back on Sepolia Etherscan. The screenshot shows your student ID, and one clear line explains the transaction to a non-technical reader.
Reasonable (3)	The transaction is sent and shown, but one part is thin. The seed-phrase security is vague, or the explanation line repeats screen labels instead of explaining.
Limited or Basic (1-2)	The lab is incomplete: no transaction shown, no student ID in the screenshot, or no explanation. See the lab evidence rule in this rubric.

C4. Session 2, Task 3 - your own write-up of the group activity (weight 13)

What is marked	Session 2 worksheet, Task 3: your own custody policy for a Bahraini firm holding about 250,000 US dollars (about 94,000 Bahraini dinars) in crypto-assets, using the custody policy template.
Excellent (5)	All six template rows hold specific choices: a cold and hot split with a reason, an approval threshold with named key holders, and a seed-phrase backup and recovery plan. One trade-off is clearly defended.
Reasonable (3)	The template is filled in and the choices are sensible. Some choices have no reason, or the trade-off is named but not defended.
Limited or Basic (1-2)	Rows are missing or generic, such as 'keep it secure', with no numbers, no named key holders, or no trade-off.

C5. Task 1 in both worksheets - the reading questions (weight 16)

What is marked	Task 1 in both worksheets. Session 1 asks about 'not your keys, not your coins', ranking wallet risk, and the failure with no recovery. Session 2 asks about the two key custody-policy decisions and the Cambridge Bitcoin Electricity Consumption Index (CBECI) energy-mix figure.
Excellent (5)	Every question is answered in two or three sentences, in your own words. Each answer is correct and explains why, not only what.
Reasonable (3)	All questions are answered and broadly correct. Some answers are one line, repeat the reading, or skip the reason.
Limited or Basic (1-2)	Several questions are missing or wrong, or the answers are copied from the reading.

BAHRAIN POLYTECHNIC بوليتكنك البحرين

C6. Analysis and judgement across the week (weight 14)

What is marked	Across the week: how well you weigh security against convenience, and energy claims against evidence.
Excellent (5)	Makes clear judgements and backs each one with a reason: why one risk ranks above another, why a trade-off is worth making, and what the evidence can and cannot show.
Reasonable (3)	Some judgement is shown, but the answers mostly describe, or reasons are stated without support.
Limited or Basic (1-2)	Description only, or opinions given with no reasons.

C7. Bahrain and Gulf Cooperation Council (GCC) grounding (weight 10)

What is marked	Across the week: the Bahraini setting of the tasks.
Excellent (5)	Uses the Bahraini setting accurately and makes it matter. For example, it shows how the family office's or the firm's situation shapes the risk and the policy choices.
Reasonable (3)	A correct Bahrain or GCC reference is made, but it could be removed without changing the answer.
Limited or Basic (1-2)	No Bahrain or GCC context, or a local fact that is wrong.

C8. Clear communication, sources and submission (weight 8)

What is marked	Both worksheets: how clear your writing is, the length of each answer, your sources, and submission.
Excellent (5)	Both worksheets are submitted. Answers are clear, plain and close to the expected length for each task. Every source you used is listed in Task 4.
Reasonable (3)	Both worksheets are submitted and can be understood. Some answers are far too long or too short, or a source is missing.
Limited or Basic (1-2)	A worksheet is missing, answers are hard to follow, or sources were used but not listed.

Worked example - what a good answer contains

A good classification names who holds the keys, and the exposure that follows from that, as the worked example does. There, an exchange account is custodial, so the main risk is that the exchange fails or is hacked.

Lab evidence rule

Your screenshots with your name or student ID visible are the evidence for the lab criterion. (1) Your name or student ID must be visible in each screenshot. (2) The lab must end with the required completion screenshot. If either is missing, the lab evidence contributes 0 and is flagged. Lab this week: Self-custody wallet lab (testnet only).

Check your own work before you submit

- Read the 'Excellent (5)' description for each criterion, then read your answer.
- Give yourself a score from 0 to 5 on each one. Where your score is below 4, add what the description says is missing.
- Check that both worksheets carry your name and student ID, and that Task 4 lists every source you used.
- Submit both worksheets to the Week 3 weekly worksheets link on Moodle by Friday 2 October 2026, 23:59.
